

Diamond Peel Microdermabrasion

Minimally Invasive Procedure

Microdermabrasion treatment is a minimally invasive procedure that sloughs off dead skin cells by gently exfoliating and suctioning with a use of a slightly abrasive tip, removing the thicker, uneven outer layer.

What should I expect during my microdermabrasion procedure?

There is no down time or recovery period following microdermabrasion. After your treatments, your healthcare provider may recommend a special moisturizer or facial product to enhance and prolong results.

Microdermabrasion Facts and Aftercare

Microdermabrasion is a simple, quick, and painless cosmetic treatment with no downtime and minimal risk. Microdermabrasion helps to gently exfoliate surface layers of skin using abrasion and suction. Microdermabrasion uses minute diamond-studded tips to abrade the skin and vacuum suction that remove dead skin cells. This treatment can help improve the skin appearance by reducing fine lines, early sun damage, and mild, shallow acne marks. It is a painless, skin rejuvenating procedure using a combination of fine abrasive tip and vacuum suction applied to the skin. There are no needles or anesthetics required for this procedure. The vacuum pressure and speed are adjusted depending on the sensitivity and tolerance of the skin. Microdermabrasion is often compared to the feeling of a cat licking your face, a rough but gentle texture. It is important that the patient uses **SPF 50**, 30 minutes prior to sun exposure and powder sunscreen (e.g. Colore Science SPF 50) every 2 hours, especially during summer.
